

TEAM SMARTSENSE · AI FOR EVERYDAY EXPERIENCES

roboforeman

Your AI builds anything — it just doesn't know your project.

One scan. Agent-ready. Ready to contribute.

THE PROBLEM

Meet Priya. Shipping a new feature.

Wrong style

Ignores how her project actually writes code

Fake commands

Calls scripts that don't exist in the repo

Breaks working code

Touches files it shouldn't — now she fixes the AI

She's correcting the assistant instead of building. Every developer here has lived this.

The AI isn't dumb — it's unbriefed.

No site map

No AGENTS.md

No rulebook

No .cursor/rules

No safety tape

No hooks / .cursorignore

No crew habits

No skills from your code

Roboforeman briefs it — so the builder stops guessing.

/scan → /build → /contribute

Drop your demo video here

Replace this frame before the pitch

01 /scan

Stack detect + honest checklist

02 /build

Rules, map, skills — backed up first

03 /contribute

Issue → fix → draft PR, no pollution

WHY NOT JUST PROMPT IT?

"Can't I just make these files myself?"

Sure — once.

For one repo.

If you remember every rule,
every time — and never commit a secret.

Roboforeman

instantly · identically

safely · on every repo

including open-source you don't own

Fun on top. Real engineering underneath.

AI for judgment

Reads your code — and your CONTRIBUTING.md

Mines skills from real exemplar files

Exa → live stack docs, not stale guesses

Deterministic for trust

Tested detection & merge scripts

Never-clobber + one-command undo

No-pollution guards on OSS PRs

Exa · ElevenLabs (the foreman speaks) · Render

Can we fix your repo? Yes we can.

Brief your AI. Build your features.

Contribute to open source — without the setup tax.
